

# Introduction to Database Systems: CS312

## SQLite and Python Primer

Oliver Bonham-Carter

2 Oct 2020

# Exam1: Friday 7<sup>th</sup> Oct Given During Lab (3:00pm)

By Honor code: you cannot talk to your colleagues about exam questions

## Exam1

Big Data

Five steps

Making  
Useful Strings

Let's Code!

## From the SLIDES

- You will have 24 hours to take the exam,
- Submitted to GitHub by Thursday, 8<sup>th</sup> by 3pm
- Builder files to create SQLite3 databases
- Creating a database from a datasets: Adding tables and data
- Writing queries
- Updating tables and data
- Using Python for simple automation
  - Basic steps to use Python to manage a database
  - Automating queries
  - (and similar conceptual questions)

# Big Data

Exam1

Big Data

Five steps

Making  
Useful Strings

Let's Code!

Multiples of bytes <span>V T E</span>					
Decimal			Binary		
Value		Metric	Value	IEC	JEDEC
1000	kB	kilobyte	1024	KiB kibibyte	KB kilobyte
1000 <sup>2</sup>	MB	megabyte	1024 <sup>2</sup>	MiB mebibyte	MB megabyte
1000 <sup>3</sup>	GB	gigabyte	1024 <sup>3</sup>	GiB gibibyte	GB gigabyte
1000 <sup>4</sup>	TB	terabyte	1024 <sup>4</sup>	TiB tebibyte	—
1000 <sup>5</sup>	PB	petabyte	1024 <sup>5</sup>	PiB pebibyte	—
1000 <sup>6</sup>	EB	exabyte	1024 <sup>6</sup>	EiB exbibyte	—
1000 <sup>7</sup>	ZB	zettabyte	1024 <sup>7</sup>	ZiB zebibyte	—
1000 <sup>8</sup>	YB	yottabyte	1024 <sup>8</sup>	YiB yobibyte	—
Orders of magnitude of data					

- Upwards of 2.7 Zetabytes of data exist in the digital universe
- YouTube users upload 48 hours of new video every minute
- Increase in unstructured data: text, photos, etc.

# Facebook's Daily Data Use

Exam1

Big Data

Five steps

Making  
Useful Strings

Let's Code!

- Facebook processes:
  - 2.5 billion pieces of content
  - upwards of 500 terabytes of data each day from status and location details
  - Processing in 2.7 billion Like actions
  - 300 million photos per day,
  - Scans roughly 105 terabytes of data each half hour
  - 100 petabytes of data are stored in a single Hadoop disk cluster (a distributed system for data management)

# Current Estimates for Users Online

Exam1

Big Data

Five steps

Making  
Useful Strings

Let's Code!

- Facebook: 2.7 Billion Active users
- Amazon: 112 Million (US users)
- SnapChat: 238 million daily active users worldwide
- Google: 4.39 Billion internet users (worldwide)
- Instagram: 1 Billion monthly active users, 500 Million each day.

Lots of names, photos, passwords and posts to record!

# How are we to **manage** all this data?

Exam1

Big Data

Five steps

Making  
Useful Strings

Let's Code!

Exam1

Big Data

Five steps

Making  
Useful Strings

Let's Code!

## PEP 0249

- Python Database API Specification v2.0
- <https://www.python.org/dev/peps/pep-0249/>
- Specifies a standard API that Python modules that are used to access databases should implement
- Does not provide a library nor a module, just specifications on how to make them
- Third party modules may adhere to these specifications

# Steps to run a command in SQL using Python

Exam1

Big Data

Five steps

Basic  
Concatenation

Making  
Useful Strings

Let's Code!

Five basic steps to using a database according to the Python Database API Specification v2.0

- Step 0: Build automation framework in Python3
- Step 1: Defining the query
- Step 2: Connecting to the database
- Step 3: Execute the query
- Step 4i, (SELECT): Analyze the result
- Step 4ii, or (UPDATE): Commit the change
- Step 5: Cleaning up; close the database connection

Nice tutorial: [http://sebastianraschka.com/Articles/2014\\_sqlite\\_in\\_python\\_tutorial.html](http://sebastianraschka.com/Articles/2014_sqlite_in_python_tutorial.html)

Exam1

Big Data

Five steps

Basic  
Concatenation

Making  
Useful Strings

Let's Code!

KEEP  
CALM  
AND  
LET'S  
CODE

# Making Useful Strings

A concatenated string

Exam1

Big Data

Five steps

Making  
Useful Strings

Queries From  
Strings

Let's Code!

Note the 'f' before the quotes for formatting

```
myCollege_str = "Allegheny"  
mesg_str = f"I go to {myCollege_str }!!"  
print(mesg_str)
```

```
myCollege_str = "Allegheny"  
myMajor_str = "CompSci"  
mesg_str = f"At {myCollege_str}, my major is {myMajor_str}"  
  
print(mesg_str)
```

Adding quotes

```
iSay_str = "Cool"  
mesg_str = f"I say my major is very a \"{iSay_str}\" major"  
print(mesg_str)
```

# Making Useful Strings

A concatenated string

Exam1

Big Data

Five steps

Making  
Useful Strings

Queries From  
Strings

Let's Code!

- Queries are strings of code that can be created by Python.
- These queries can be sent to database management software

## Making a Query Statement

```
a1_str = "deptName"  
a2_str = "course"  
name_str = "Miller"  
table_str = "Instructor"
```

```
myQuery_str = f"SELECT {a1_str}, {a2_str} FROM {table_str} WHERE name == \"{name_str}\""
```

```
print(myQuery_str)
```

# Making Useful Strings

A concatenated string

Exam1

Big Data

Five steps

Making  
Useful Strings

Queries From  
Strings

Let's Code!

## Making An Insert Statement

```
myTable = "Instructor"  
PersonID = "10101"  
name_str = "Miller"  
student = "S1"
```

```
insert_str = f"INSERT INTO {myTable} VALUES({PersonID}, \"{name_str}\", \"{student}\")"
```

```
print(insert_str)
```

# Python to manage database

Exam1

Big Data

Five steps

Making  
Useful Strings

Let's Code!

## Let's Try It Out!

- Locate the sandbox database builder file  
sandbox/campusDB\_build.txt and make your DB.
- Find Python source,  
sandbox/simpleQueries/simpleQuery1.py

**THINK**
