Basic Query  
Structures

Clauses

CampusDB

Removing  
Tables or  
Data

The SQL data-manipulation language (DML) provides the ability to query information, and insert, delete and update tuples

A typical SQL pseudo code query has the form:

```
SELECT A1, A2, ..., An  
FROM r1, r2, ..., rm  
WHERE P;
```

- $A_i$  represents an attribute
- $R_i$  represents a relation
- $P$  is a predicate
- The result of an SQL query is a relation

# The SELECT Clause

Connections

Basic Query  
Structures

Clauses

SELECT

WHERE

CampusDB

Removing  
Tables or  
Data

The SELECT clause filters out particular data from a table.

- SQL allows duplicates in relations as well as in query results.
- The SELECT statement has many optional clauses:
  - WHERE specifies which rows to retrieve.
  - GROUP BY groups rows sharing a property so that an aggregate function can be applied to each group.
  - HAVING selects among the groups defined by the GROUP BY clause.
  - ORDER BY specifies an order in which to return the rows.
  - AS provides an alias which can be used to temporarily rename tables or columns..

# Given table 'T'

Connections

Basic Query  
Structures

Clauses

SELECT

WHERE

## TeaDB

## Removing Tables or Data

```
cat builder_teaDB.txt | sqlite3 teaDB.sqlite3
```

# The **SELECT** Clause

TeaDB

Connections

Basic Query  
Structures

Clauses

**SELECT**

WHERE

CampusDB

Removing  
Tables or  
Data

- Find everything in the Department table.

- `SELECT * FROM Department;`

- Find all entries for *dept's* of the Department table

- `SELECT dept from Department;`

- Count entries of *dept's* in Department table,

- `SELECT COUNT(dept) FROM department;`

# The **SELECT** Clause

## TeaDB

Connections

Basic Query  
Structures

Clauses

**SELECT**  
WHERE

CampusDB

Removing  
Tables or  
Data

- Find all unique entries for *depts* in Department table,

- SELECT DISTINCT(dept) FROM department;

- Count unique entries of *depts* in Department table,

- SELECT COUNT(DISTINCT(dept)) FROM Department;  
/\*count unique occurrences\*/

- Return the exhaustive set of sandwiches that are being ordered.

- SELECT DISTINCT(sandwich) FROM Tea;  
/\*Everyone gets one type of this sandwich from this set \*/

Connections

Basic Query  
Structures

Clauses  
SELECT  
**WHERE**

CampusDB

Removing  
Tables or  
Data

The **WHERE** clause: **conditions** that the result must satisfy

- Corresponds to the selection predicate of the relational algebra
- Comparison results can be combined using the logical connectives and, or, and not
- Comparisons can be applied to results of arithmetic expressions

# The WHERE clause

## TeaDB

Connections

Basic Query  
Structures

Clauses

SELECT

WHERE

CampusDB

Removing  
Tables or  
Data

- Find out who is ordering a sandwich less than \$15 (from the new cost column)

```
SELECT * FROM tea where cost < 15;
```

- Find department, Session material, sandwich type for orders of sandwiches less than \$15.

```
SELECT Department.id, Session.session, tea.sandwich, tea.cost  
FROM Tea, Department, Session WHERE cost < 15 AND  
Department.id == Session.id AND Department.id == Tea.id;
```

- Find out what kinds of *sandwiches* are going to each *dept*

```
SELECT department.dept, tea.sandwich FROM department, tea  
where department.id == tea.id;
```

# The WHERE clause

## TeaDB

Connections

Basic Query  
Structures

Clauses

SELECT

WHERE

CampusDB

Removing  
Tables or  
Data

- Find out which professors are presenting posters

- `SELECT * FROM session WHERE material == "poster"; /* show all*/`
- `SELECT ID, material FROM session WHERE material == "poster"; /*which professor is doing what?*/`

- Find how who is presenting a poster, having what kind of sandwich which costs over \$10

- `SELECT session.ID, session.material, tea.sandwich, tea.cost FROM session, tea WHERE session.material == "poster" AND tea.cost > 10 AND session.id == tea.id;`

# CampusDB

```
cat campusDB_build.txt | sqlite3 CampusDB.sqlite3
```

# Abbreviations in queries

## CampusDB

Connections

Basic Query  
Structures

Clauses

CampusDB

Abbreviations  
in Queries

Aggregate  
Functions

Removing  
Tables or  
Data

Find which students are working with what instructors.

- `SELECT Instructor.ID, Instructor.name, Instructor.studentId, Student.name, Student.Id FROM Instructor, Student WHERE Instructor.studentId == Student.ID;`

Shorter way to write query by using abbreviations

- `SELECT i.ID, i.name, i.studentId, s.name, s.Id FROM Instructor i, Student s WHERE i.studentId == s.ID;`

- The “**Instructor**” table name can be replaced with an **i**.
- The “Student” table name can be replaced by an “s”.

Structures

Clauses

CampusDB

Abbreviations  
in Queries

Aggregate  
Functions

Removing  
Tables or  
Data

These functions operate on the multiset of values of a column of a relation, and return a value

- **avg**: average value
- **min**: minimum value
- **max**: maximum value
- **sum**: sum of values
- **count**: number of values

Connections

Basic Query  
Structures

Clauses

CampusDB

Abbreviations  
in Queries

Aggregate  
Functions

Removing  
Tables or  
Data

To find all instructors in Comp. Sci. dept with salary > 80000

- `SELECT name FROM instructor WHERE deptName = "CompSci" AND salary > 80000;`

### Using functions

- `SELECT AVG (salary) FROM instructor WHERE deptName = "CompSci";`
- `SELECT MIN (salary) FROM instructor WHERE deptName = "CompSci";`
- `SELECT MAX (salary) FROM instructor WHERE deptName = "CompSci";`
- `SELECT SUM (salary) FROM instructor WHERE deptName = "CompSci";`
- `SELECT COUNT (salary) FROM instructor WHERE deptName = "CompSci";`

Connections

Basic Query  
Structures

Clauses

CampusDB

Abbreviations  
in Queries

Aggregate  
Functions

Removing  
Tables or  
Data

- Find the ID, name and total credit students who are taking a course where the total credit is 3 or 4 hours.

- `SELECT ID, name, totCred FROM student WHERE totCred == "3" OR totCred == "4";`

Watch out for cross products that give no usable information!!

- `SELECT s.name, i.name from student s, instructor i WHERE s.deptName == i.deptName and s.deptName == "CompSci";`
- Use two queries instead:
  - `SELECT s.name from student s WHERE s.deptName == "CompSci";`
  - `SELECT i.name from instructor i WHERE i.deptName == "CompSci";`

# Using Count and Count(Distinct())

## CampusDB

Connections

Structures

Clauses

CampusDB

Abbreviations  
in Queries

Aggregate  
Functions

Removing  
Tables or  
Data

### Find the number of tuples in the course relation

- `SELECT COUNT(credits) FROM course;`
- `SELECT COUNT(distinct(credits)) FROM course;`
- `SELECT COUNT (*) FROM course;`
- `SELECT COUNT (distinct(*)) FROM course;`
- Question: Why will the above *distinct* line **not** work?

# Removing Tables or Data

## CampusDB: Adding data to Student table

Connections

Basic Query  
Structures

Clauses

CampusDB

Removing  
Tables or  
Data

Changing Table  
Contents

- DROP TABLE student
  - Deletes the table and its contents
- DELETE FROM student
  - Deletes all contents of table, but retains table

# Changing Table Contents

Connections

Basic Query  
Structures

Clauses

CampusDB

Removing  
Tables or  
Data

Changing Table  
Contents

- ALTER TABLE

- Alter table  $r$  add  $AD$
- where  $A$  is the name of the attribute to be added to relation  $r$  and  $D$  is the domain of  $A$ .
- All tuples in the relation are assigned null as the value for the new attribute.
- Change name of table:
  - `ALTER TABLE department RENAME TO newDept;`

- Add a column to a table

- `ALTER table course ADD COLUMN courseTag char(1);`
- Check your additional column:
  - `.schema course`
